

Ottawa Manlift Training

Ottawa Manlift Training - There are numerous manlift training programs which offer a review of the manlift machinery. The practicum part of the training is another vital portion of the program. In this section the trainee has chance to demonstrate their practical abilities, their ability to operate the manlift safely. A prerequisite to Manlift training is the fall protection training, which may be incorporated in the training based on the specific requirements of the customer.

Course Content

The program content comprises: the impact of performing unsafe acts or utilizing unsafe machinery, pre-shift machine inspection and work area survey requirements, Lifting device machine definitions, Review of load capabilities, safety decals and particular machine requirements, Review of related sections of the CSA Standards as well as the OHSA Standards and Review site particular Dangers, together with controls for safely utilizing a lifting device.

Demonstration and Evaluation Content

The evaluation and demonstration portion of the course includes: making use of a signaler or a spotter when needed; Proper personal protective equipment or P.P.E. as required; Operating a lift only on level and solid ground; Making use of the proper fitting harness or fall arrest device; Utilizing the lift with all other employees clear of the job place; Aware of load restrictions etc. and other specs as set out by the manufacturer; Pre-shift work area survey and equipment inspection; Having all associated equipment safely stored on the lift platform; Isolating off the work area when major work projects are to be carried out; and ensuring a safe and smooth operating speed for various plant conditions

Each person would be tested to make certain they could efficiently and safely use your site-specific machine.

Manlift Safety

Manlifts could be extremely dangerous machines since they are capable of lifting an employee 20 feet or higher in the air and that creates a particular amount of danger. Because the danger is so apparent, lift operators and owners are careful to properly maintain their machines and follow correct safety measures and operating procedures. The ratio of accidents involving this specific apparatus is quite low.

The safety specifications for boom lifts and scissor lifts puts the burden for safe manlift operation on the user. You are responsible for knowing how to safely operate the lift even if you just lease the machine for a day. The most basic safety features on the machinery are the operating guidebook and safety decals. These show important information about the operating procedures, safety machinery and maintenance.

Newer lift models will come together with instruction manuals and decals in place. Technically, the operating manual should be kept on the lift itself. If you are buying a second-hand lift, it is essential to ensure that the manual is included and that essential decals haven't been painted over. The restraints that prevent operators from falling and the guardrails are other important safety features. These are standard and mandatory on all types of lifts.
